Part 3: Site Critique

I picked the ThinkTac homepage (<https://thinktac.com>) for this.

Performance/Technical:

The first thing that stood out was the hero background video autoplaying immediately when the page loads, without a lazy-loading strategy or a reduced-motion fallback. Another noticeable issue is that all curriculum tabs (CBSE Science, CBSE Maths, CBSE Science Lab, NCERT Science, NCERT Maths, ICSE Science, and State Boards) display the same promotional media instead of curriculum-specific content. This results in unnecessary media loading and provides little additional value to users. I also noticed that the page uses a very high-resolution Open Graph image for social sharing, which is larger than necessary and increases page size without improving the user experience.

UX/Product Gap:

The website is built on Shopify, so standard e-commerce elements such as the Cart and cart notifications are visible even though the homepage primarily serves as an educational information and lead-generation website. The larger issue is that every curriculum tab displays identical promotional content. Since each curriculum highlights different activities and learning outcomes, users expect to see content related to the selected programme. Showing the same media across all tabs reduces the effectiveness of the curriculum showcase and makes the experience feel less polished.

Concrete Suggestion:

Replace the shared promotional media with curriculum-specific content. Each curriculum tab should include a short demonstration video or an image carousel showcasing the activities and experiments related to that programme. This only requires updating the content in the existing Shopify section and does not require any application code changes. It would give visitors a clearer understanding of each curriculum and create a more engaging and professional user experience.
